particles. The problem is that to maintain a vacuum in a region you have to shield it from the environment. It is not difficult to make a container that would prevent atoms from entering the region.

Is it possible to make a perfect vacuum?

A vacuum is defined as a space devoid of all matter. In the Solar System, space contains on average five atoms per 1cm^3 . Interstellar space, between stars, contains around one atom per 1cm^3 , while intergalactic space, between galaxies, contains 100 times less. Ultimately, a perfect vacuum isn't possible because quantum theory dictates that energy fluctuations known as 'virtual particles' are constantly popping in and out of existence, even in 'empty' space.

The term vacuum is often misunderstood and consequently misapplied when discussing pressure measurements and choosing pressure transducers. By definition, vacuum is a space that is partially exhausted (as to the highest degree possible) by artificial means (such as an air pump).

Vacuum Pressure: What is it & how do you measure it?

A vacuum is a volume that encloses little or no matter. In other words, it is a region that has a gaseous pressure much lower than that of atmospheric pressure. A partial vacuum is a vacuum with low amounts of matter enclosed. A total, perfect, or absolute vacuum has no matter enclosed. Sometimes this type of vacuum is referred to as "free space."
