That's done through the oil breather tube, a section of plastic or metal tubing that comes out of the engine and vents through to the outside. Although this benign little hose doesn't require much maintenance, it does have one major drawback—a blocked breather tube can pressurize the engine and cause seals to fail.

The breather pipe works well for the family car, but racing engines require added venting and often incorporate an air pump to pull the air out of the crankcase. This vacuum pump draws more air out of the engine than can be vented through a pipe.

However, before you rush out to buy the biggest size breather pipe kit you can lay your hands on, many other factors need to be taken into account and the following points should be observed: 1) On 'wet sump' engines the sump must never be overfilled and it should be properly baffled to minimise oil surge.

Hi, on the small continentals, the aluminum breather tube has a short section of rubber hose that connects it to the bronze 90° elbow that is screwed into the crankcase. If you leave a 1" gap/space between the two, you can put a slit in the rubber hose with a razor blade that will act as a valve on pressure only, if the 90° fitting is turned to the back and up, put the slit on the top of the hose.

As a bonus, the Lycoming engine also tends to spit a fine oil mist out the breather as well, which inevitably ends up all over the belly of the airplane. At the source of the breather tube, my engine came with a straight 3/4" brass fitting that sticks out of the accessory case at an angle... and dead-ends right into the engine mount.

An aircraft engine (1) with a device (17) for separating oil from an air-oil volume flow is described, wherein a fluid volume flow with a lower oil load than the air-oil volume flow supplied to the device (17) is conducted over a line region (29) is dischargeable from the device (17). The fluid volume flow can be supplied via the line region (29) to a device (28) by means of which a pressure ...

Without a breather, seals and gaskets would quickly blow out, making an oily mess of the entire engine compartment and leaving your engine dangerously low on oil. The breather connection is a 3/4-inch slip-on hose fitting at the top of the accessory case, right next to the point of connection for the oil-return line from the cooler.

## **smoke coming out of engine breather hose | PlanetMinis Forums**

In an internal combustion engine, a crankcase ventilation system removes unwanted gases from the crankcase. The system usually consists of a tube, a one-way valve and a vacuum source (such as the intake manifold). The unwanted gases, called "blow-by", are gases from the combustion chamber which have leaked and pass through the piston rings.
