RNA contains the coded information for making proteins. The RNA molecule is the disposable copy of a segment of DNA. RNA is the working segment of a single gene. The ability to copy a single DNA sequence into RNA makes it possible for a single gene to produce hundreds or thousands of RNA molecules.

The RNA is another nucleic acid that translates genetic information into proteins from DNA. The nucleotides are linked together for the formation of two long strands which spiral to produce a structure known as the double-helix which resembles that of a ladder wherein the sugar and phosphate molecules form the sides while the rungs are formed by the bases.
