In essence, BRBF represent a direct application of the principles of seismic design of steel systems for ductility. All seismic systems listed in the AISC Seismic Provisions for Structural Steel Buildings ("AISC 341," AISC, 2005) are intended to translate material ductility into some degree of system ductility.

Buckling-restrained braces (BRBs) have become popular as ductile seismic force-resisting elements in building structures. This is due in part to a comprehensive design guide for BRB frames and a substantiated component prequalifying test loading protocol provided in the AISC Seismic Provisions for Structural Steel Buildings (AISC 2016).
