Canine parvovirus 2 (CPV-2), the causative agent of one of the most severe diseases in dogs, was first identified in 1978 after an epizootic of gastroenteritis and myocarditis, and is now occurring worldwide.

17 The investigation of the evolutionary

Background: Canine parvovirus type 2 (CPV-2) was first identified in the late 1970s; it causes intestinal hemorrhage with severe bloody diarrhea in kennels and dog shelters worldwide. Since its emergence, CPV-2 has been replaced with new genetic variants (CPV-2a, CPV-2b, and CPV-2c). Currently, information about the genotype prevalence of
