A data structure should be seen as a logical concept that must address two fundamental concerns. 1. First, how the data will be stored, and 2. Second, what operations will be performed on it. As data structure is a scheme for data organization so the functional definition of a data structure should be independent of its implementation.

The term data structure is used to describe the way data is stored. To develop a program of an algorithm we should select an appropriate data structure for that algorithm. Therefore, data structure is represented as: Algorithm + Data structure = Program A data structure is said to be linear if its elements form a sequence or a linear list. The linear

□ Data structure is a representation of the logical relationship existing between individual elements of data. □ Data Structure is a way of organizing all data items that considers not only the elements stored but also their relationship to each other. □ We can also define data structure as a mathematical or logical model of a particular organization of data items. □ The representation of particular data structure in the main memory of a computer is called as storage structure.

### **Introduction to Data Structure**

i. Simple: built from primitive data types like int, char & Boolean. eg: Array & Structure ii. Compound: Combined in various ways to form complex structures. 1:Linear: Elements share adjacency relationship & form a sequence. Eg: Stack, Queue, Linked List 2: Non-Linear: Are multi-level data structure. eg: Tree, Graph. ABSTRACT DATA TYPE :

The data structure name indicates itself that organizing the data in memory. There are many ways of organizing the data in the memory as we have already seen one of the data structures, i.e., array in C language. Array is a collection of memory elements in which data is stored sequentially, i.e., one after another.
