The term "parallel distributed processing" (PDP) is not widely used in the ANN field, for instance. The two remaining PDP books, both titled Explorations in parallel distributed processing: a handbook of models, programs, and exercises, are manuals for the software that accompanies the original two-volume PDP set—one for DOS (two 5.25-inch disks) and one for the Macintosh (two 3.5-inch disks).

Parallel Distributed Processing (PDP) models are a class of neurally inspired information processing models that attempt to model information processing the way it actually takes place in the brain. This model was developed because of findings that a system of neural connections appeared to be distributed in a parallel array in addition to serial pathways.

Symbolic approaches, such as semantic networks, have been successful at representing structured knowledge for parallel access. However, such approaches have had difficulty organizing multiple instances for automatic generalization and efficient retrieval. Parallel distributed processing systems (PDP) appear to offer a solution to these problems.

David Everett Rumelhart was an American psychologist who made many contributions to the formal analysis of human cognition, working primarily within the frameworks of mathematical psychology, symbolic artificial intelligence, and parallel distributed processing. He also admired formal linguistic approaches to cognition, and explored the possibility of formulating a formal grammar to capture the structure of stories.
