Without going into detail here are the equations for calculating the flow for a gas in pipes larger than 5CM in diameter. These are based on ISO 1991 and 1998. Corner Pressure Taps: $L_1 = L_2 = 0.5 D$ and D/2 Pressure Taps: $L_1 = 1 D$ and $L_2 = 0.47 D$ Flange Pressure Taps: $L_1 = L_2 = 0.0254/D$ where D is in meters.

The orifice meter, the nozzle meter, and the Venturi meter are the most common devices used to measure the instantaneous flowrate. Each of these meters operates on the similar principle. As the flow area in a pipe decreases, the flow velocity that is accompanied by a decrease in pressure increases in a pipe.

On one side of the meter (A), the teeth of the gears close off the fluid flow because the elongated gear on side A is protruding into the measurement chamber, while on the other side of the meter (B), a cavity holds a fixed volume of fluid in a measurement chamber. As the fluid pushes the gears, it rotates them, allowing the fluid in the measurement chamber on side B to be released into the outlet port.
