This involves choosing a set of generators, constructing a certain graph (the Cayley diagram or DEHNsehe Gruppenbild), and embedding the graph into a surface. Cases in which the surface is a sphere or a plane are described in Chapter 4, where we obtain algebraically, and verify topologically, an abstract definition for each of the 17 space ...

Generators and Relations for Discrete Groups. When we began to consider the scope of this book, we envisaged a catalogue supplying at least one abstract definition for any finitely generated group that the reader might propose. But we soon realized that more or less arbitrary restritlions are necessary, because interesting groups are so numerous. For permutation groups of degree 8 or less (i.e., subgroups of 2: ), the reader cannot do better than consult the 8 tables of JOSEPHINE BURNS ...

Theorem: Every group \langle G \rangle which can be generated by \langle n \rangle elements can be represented as the homomorphic image of the free group \langle F \rangle on \langle n \rangle generators. The kernel of this map consists of elements of \langle F \rangle that correspond to relations in \langle G \rangle.

In mathematics, a presentation is one method of specifying a group.A presentation of a group G comprises a set S of generators—so that every element of the group can be written as a product of powers of some of these generators—and a set R of relations among those generators. We then say G has presentation 

⟨
S
∣
R

{\displaystyle \langle S\mid R\rangle }

. Informally, G has the above presentation if it is the "freest group" generated ...
