buildings in that can be your partner.

If you're looking for some fun fiction to enjoy on an Android device, Google's bookshop is worth a look, but Play Books feel like something of an afterthought compared to the well developed Play Music.

Indoor Radon Measurements Of The

A generally accepted action level established by the World Health Organization, the WHO, is 100 Bq/m³, or 2.7 pCi/L. Homes or structures measuring higher are advised to take remedial action to lower radon levels. The WHO further advises an upper limit that should not be exceeded at 300 Bq/m³, or 8 pCi/L.

Radon levels: What do they mean? - Smart Radon & Indoor ...

The average concentration of radon in American homes is about 1.3 picocuries per liter and the average concentration in outdoor air is about 0.4 picocuries per

liter. The U.S. EPA recommends that individuals avoid long-term exposures to radon concentrations above 4 picocuries per liter.

Indoor Radon

Typical short-term EICs are designed to measure radon for 2 to 15 days at a concentration of 150 Bq/m³. The long-term EICs measure radon over 3 to 12 months at a concentration of 150 Bq/m³. EICs have been described previously (Kotrappa et al. 1990).

Radon measurements - WHO Handbook on Indoor Radon - NCBI ...

Despite dilution by infiltrating surface air, radon produced by the gravel channel was approximately 12.7 Bq s⁻¹, which is sufficient to produce indoor radon concentrations above 222 Bq m⁻³ in a typical single-story house with a ventilation rate of 0.5 air changes per hour. ScienceDirect Topics

2.1 Indoor Radon Measurements Indoor radon measurements were performed in 167 private homes across the five most populated areas. The types of houses that were tested for radon were single detached houses, town homes, and row units. Electret ion chambers (E-PERMs produced by Rad Elec Inc.) were used in this informal survey. Short-

and measurement techniques. The variation of radon concentration during the comparison showed a big range of values, with levels from approximately 0.5 to 30 kBq/m³. The reference values for the two exposure periods have been derived from a weighted average of participants' results applying an iterative algorithm. The

methods are needed for identification of radon priority areas. Open-faced charcoal canisters for indoor radon measurements are studied.

Contributions to uncertainty budget are identified and their magnitudes estimated. Combined uncertainty is estimated for good practice and bad practice examples.

Radon measurements using open-faced charcoal canisters ...

The current Canadian guideline for radon in indoor air for dwellings is 200 becquerels per cubic metre (200 Bq/m³). This guideline provides Canadians with guidance on when remedial action should be taken to reduce radon levels.

Guide for Radon Measurements in Residential Dwellings ...

Radon is a naturally occurring radioactive gas that can cause lung cancer. You can't see or smell radon. Testing is the only way to know your level of exposure. Radon can have a big

impact on indoor air quality.

Radon | US EPA

WHO fact sheet on radon and cancer: includes key facts, definition, health effects, radon in homes, radon in drinking water, WHO response.

Radon and health

Radon is the leading cause of lung cancer among non-smokers, and the second leading cause of lung cancer in America, claiming about 20,000 lives annually. Radon gas comes from the natural (radioactive) breakdown of uranium in soil, rock and water. It is found in every part of the U.S., and can get into any type of building.

Radon Overview

The average year-round residential indoor radon level is estimated to be about 1.3 pCi/L, and about 0.4 pCi/L of radon is normally found in outside air. The U.S. Congress has set a long-term goal that indoor radon levels be no more

than outdoor levels.

Indoor Radon and Radon Decay Product Measurement Device ...

By building radon-resistant new homes, builders and contractors provide a public health service — helping to reduce buyers' risk of lung cancer from exposure to radon in indoor air. Using common materials and straightforward techniques, builders can construct new homes that are resistant to radon entry.

Radon-Resistant Construction Basics and Techniques | US EPA

Radon measured in the full sample (470 689 homes) is observed to be log-normally distributed with a geometric mean of 46.6 Bq/m³ and an arithmetic mean of 96.0 Bq/m³ after subtracting for outdoor radon. Figure 3 shows the distribution of radon measurements for the full dataset. Figure 3 Open in figure viewer PowerPoint
