### Induction And Synchronous Machines

An induction machine can be operated as a generator, a motor or a brake: for negative slip (speed above synchronous) the machine is a generator, for positive slip between 0 and 1 (speed below synchronous) the machine is a motor, for positive slip greater than 1 (speed negative) the machine is a brake,

May 27, 2019 · 5 min read. The basic difference is that an induction motor is an asynchronous machine whereas the other one, as the name suggests is a synchronous machine.

### Basic Difference Between Induction Motor and Synchronous ...

Synchronous motor always runs at a speed equal to its synchronous speed. i.e. Actual speed = Synchronous speed or  $N = N_s = 120f/P$ ; Learn more about working of a synchronous motor here. Induction motor: When the stator is fed with two or three phase AC supply, a Rotating Magnetic Field (RMF) is produced. The relative speed between stator's rotating magnetic field and the rotor will cause an induced current in the rotor conductors.

### Difference between Synchronous motor and Induction motor ...

Basic Principles of Synchronous Machine. A synchronous machine is just an electromechanical transducer which converts mechanical energy into electrical energy or vice versa. The fundamental phenomenon or law which makes these conversions possible are known as the Law of Electromagnetic Induction and Law of interaction.

### What is a Synchronous Machine? - its Basic Principles ...

In a synchronous motor, the magnetic field and the shaft rotate at the same speed. In an induction motor, the shaft rotates at a lower speed than the magnetic field. Induction motors are also called asynchronous motors. In both cases, the speed of the rotating magnetic field is called the synchronous speed, and it can be calculated based on the voltage supply frequency (in Hertz) and the number of poles in the motor's magnetic field.

### Induction and Synchronous Motors: Similarities and ...

Because of this, induction motors are typically unable to maintain a constant speed under variable load torque applications. Synchronous motors best serve their purpose in larger applications, whereas Groschopp specializes in fractional horsepower motors, which typically don't require synchronous motor attributes.

### Synchronous & Induction Motors: Discovering the Difference ...

Because an induction motor has no brushes, commutator or similar moving parts, it is less expensive to manufacture and maintain than other types of motors. In contrast, consider a synchronous motor. Here, the rotor turns at the same rate — that is, in synchronization — as the stator's magnetic field.

### Induction motor vs synchronous: What's the difference?

A three phase Synchronous motor is a doubly excited machine, whereas an induction motor is a single excited machine. The armature winding of the Synchronous motor is energized from an AC source and its field winding from a DC source. The stator winding of Induction Motor is energized from an AC source.

Induction and permanent-magnet synchronous machines for high-speed applications Abstract: Solid-rotor induction motors are mechanically very robust and therefore potential candidates for highspeed electric drives.

### Synchronous and induction machines notes

Since rotation at synchronous speed would result in no induced rotor current, an induction motor always operates slightly slower than synchronous speed. The difference, or "slip," between actual and synchronous speed varies from about 0.5% to 5.0% for standard Design B torque curve induction motors.

Well, till now we have discussed the requirement of longer air gap length in synchronous machine. The concept is though not applicable for induction machine. In Induction Machine (IM) effort is made to minimize the air gap length. An Induction Motor works on the principle of Electromagnetic Induction.

### Why Air Gap Length in Synchronous Machine is more than ...

A synchronous motor is termed doubly fed if it is supplied with independently excited multiphase AC electromagnets on both the rotor and stator. The synchronous motor and induction motor are the most widely used types of AC motor. The difference between the two types is that the synchronous motor rotates at a rate locked to the line frequency since it does not rely on current induction to produce the rotor's magnetic field.

Synchronous Motor. The synchronous motor doesn't rely on induction current for working. In these motors, unlike induction motor, multiphase AC electromagnets are present on the stator, which produces a rotating magnetic- field. Here rotor is of a permanent magnet which gets synced with the rotating magnetic- field and rotates in synchronous to the frequency of current applied to it.

The most common type of 3 phase motors are synchronous motors and induction motors. When three-phase electric conductors are placed in certain geometrical positions (i.e. in a certain angle from one another) - an electrical field is generated.
