H. Reinecke, ... S.M. Karazi, in Reference Module in Materials Science and Materials Engineering, 2016. Abstract. Mechanical machining processes have been used for decades for the production of components made from a wide variety of different materials. In particular, the processing of metals and alloys such as copper, brass, bronze and steels is used for the fabrication of single products, such as tools, as well as standard products.

Most machining parameters are determined by the machine operator during the generation of the G-code and are usually of little interest to the designer. The machine parameters of interest are the build size and the accuracy of the CNC machine: CNC machines have a large build area. CNC milling systems can machine parts with dimensions of up to 2000 x 800 x 100 mm (78" x 32" x 40") and CNC turning systems can manufacture parts with diameter of up to Ø 500 mm (Ø 20").
