The Laws of Cosines and Sines We saw in the section on oblique triangles that the law of cosines and the law of sines were useful in solving for parts of a triangle if certain other parts are known. The question here is “why are those laws valid?”

The Law of Cosines - Math Is Fun

The Law of Sines (or Sine Rule) is very useful for solving triangles: $a \sin A = b \sin B = c \sin C$. It works for any triangle: a , b and c are sides. A , B and C are angles. (Side a faces angle A , side b faces angle B and. side c faces angle C).

Math Is Fun

The Law of Cosines tells us that a^2 is going to be equal $b^2 + c^2 - 2bc \cos A$. Now, if we were dealing with a pure right triangle, if this was 90 degrees, then a would be the hypotenuse, and we would be done, this would be the Pythagorean Theorem.

When you are missing side lengths or angle measurements of any triangle, you can use the law of sines, or the law of cosines, to help you find what you are looking for. The law of sines is $a \sin A = b \sin B = c \sin C$

$$\left\{ \frac{a}{\sin A} \right\} = \left\{ \frac{b}{\sin B} \right\} = \left\{ \frac{c}{\sin C} \right\}.$$
