Includes reports from the international community as well as an interactive world map. NEW! Read the Online First version of Transplantation's first COVID write-up here.

Transplantation

Organ transplantation is now used routinely to treat congenital and otherwise irreversible disorders. The immunosuppression necessary to prevent rejection has the result that infections with pathogens that typically cause benign childhood illnesses can instead be severe and life-threatening.

Immunization of Pediatric Solid Organ Transplant ...

The pediatric heart transplant recipient represents a unique immunologic situation for organ transplantation because the cellular, endocrine, and humoral components of the immune system mature postnatally. These changes are most pronounced in infancy, but continue to occur throughout childhood and adolescence.

Pediatric Issues in Solid Organ Transplantation

The incidence of hepatocellular malignancy in a significant majority of children after the age of 2 years, however, mandates LTx prior to this time. Of course, children who present with acute liver failure and tyrosinemia or complications of cirrhosis require earlier transplantation.

Pediatric Issues in Solid Organ Transplantation
