Electricity. Thermistor.. What is a Thermistor?. A thermistor is a component whose resistance changes when its temperature changes. A thermistor is a special type of resistor whose resistance decreases as its temperature increases.. A plot of resistance against temperature for a thermistor is shown above. The plot is unusual because it shows that a bigger current will flow

The word thermistor is a combination of words "thermal" and "resistor". A thermistor is a temperature-sensing element composed of sintered semiconductor material and sometimes mixture of metallic oxides such as Mn, Ni, Co, Cu and Fe, which exhibits a large change in resistance proportional to a small change in temperature.

Thermistors ISA Method - GCSE Physics GCSE Additional Science. This is a method for the Thermistors ISA in the AQA GCSE Additional Science and GCSE Physics courses. The higher the temperature the lower the resistance of the thermistor. This is because as the thermistor is heated more electrons gain enough energy to move into the conduction band and act like free electrons.
