Mimicry of leaves by insects is an adaptation for evading predators. This example is a katydid from Costa Rica. The creosote bush is a desert-dwelling plant that produces toxins that prevent other plants from growing nearby, thus reducing competition for nutrients and water. Echolocation in bats is an adaptation for catching insects.

Four major adaptations are found in all terrestrial plants: the alternation of generations, a sporangium in which the spores are formed, a gametangium that produces haploid cells, and apical meristem tissue in roots and shoots. The evolution of a waxy cuticle and a cell wall with lignin also contributed to the success of land plants.

Where To Download Plant Evolution And Adaptations Study Guide Answers

Plant adaptation arises from their morphology, itself a product of evolution and development. In this figure, the aspects and interactions of research at different levels are shown, with the work having implications across botany, including understanding plant phylogeny and speciation, and for ecology and ecosystems.
