The proximate analysis of coal separates the products into four groups: (1) moisture, (2) volatile matter, consisting of gases and vapors driven off during pyrolysis, (3) fixed carbon, the nonvolatile fraction of coal, and (4) ash, the inorganic residue remaining after combustion.

The most common coal analysis is proximate analysis. It is used on coals during exploration, mining, and preparation. Four different parameters are measured from one sample in a proximate analyzer, which is an automated instrument. Ash yield (the material in coal that will not combust)

Ultimate Analysis of Power Plant Coal

The proximate analysis is the most common form of coal evaluation and it reveals the quality of a coal sample. It examines four factors including the moisture, ash, volatile matter (VM), and fixed carbon (FC) within the coal sample. Every factor is determined through a distinct experimental procedure under ASTM
