The most complex and elegant way to export QList of custom objects to QML is to subclass one of the Qt abstract models (QAbstractItemModel, or easier QAbstractListModel, QAbstractTableModel) and build up a whole model with user specified roles. Subclassing QAbstractItemModel allows you to define all the properties and behaviour of your model, however in this case it is enough to subclass QAbstractListModel.

My thoughts, 'tricks' and interests on Qt, QML, Raspberry ...

QML looks like CSS on steroids and if you have an understanding of CSS its' easy to grasp QML quickly. QML is used to define "elements" of a UI. Every element has an ID and we refer to an element by its ID. Qt Creator is called so because you can create a UI by dragging and dropping (and editing properties) an element in the Creator window.
