Oracle Web Services Manager (WSM) is designed to define and implement Web services security in heterogeneous environments, including authentication, authorization, message encryption and decryption, signature generation and validation, and identity propagation across multiple Web services used to complete a single transaction.

Understanding Web Services Security Concepts

This WS-Security implementation is part of the Java Web Services Developer Pack (Java WSDP). Like any other endpoint interceptor, it is defined in the endpoint mapping (see Section 5.4, "Endpoint mappings"). This means that you can be selective about adding WS-Security support: some endpoint mappings require it, while others do not.

Chapter 7. Securing your Web services with Spring-WS

A web services client propagates a SAML token to the web services provider as a means of identifying the requester, and the web services provider can use this SAML token information to authenticate the requester. The requirement of a SAML token is expressed as one of the supporting tokens in the WS-Security policy.

Chapter 7. Securing your Web services with Spring-WS

Web services need to authorize web service clients the same way web applications authorize users. A web service needs to make sure a web service client is authorized to perform a certain action (coarse-grained) on the requested data (fine-grained). Rule: A web service should authorize its clients whether they have access to the method in question.
