Semiconductor Device and Material Characterization

An important aspect of assessing the material quality and device reliability is the development and use of fast, nondestructive and accurate electrical characterization techniques to determine important parameters such as carrier doping density, type and mobility of carriers, interface quality, oxide trap density, semiconductor bulk defect density, contact and other parasitic resistances and oxide electrical integrity.

Electrical Characterization of Semiconductor Materials and ...

A key ingredient of this technological dominance has been the rapid advances in the quality and processing of materials—semiconductors, conductors and insulators—thus providing the complementary metal-oxide-semiconductor device technology with its important characteristics of negligible standby power dissipation, good input-output isolation, surface potential control and reliable operation.

Major Requirements. Basic device characterization and modeling requires accurate I-V/C-V, 1/f, RTN, RF, mmW, load pull and noise measurement of devices under temperature controlled and EMI-shielded test environment. Typical technical challenges include repeatability of the measurement, reliable probe contact, internal or external noise influences, current leakage of the probes and chucks, thermal performance of the system, testing over a variety of temperatures, reducing the soaking time ...
