Not even the Hubble Space Telescope can discern evidence of the Apollo landings. The laws of optics define its limits. Hubble's 94.5-inch mirror has a resolution of 0.024" in ultraviolet light, which translates to 141 feet (43 meters) at the Moon's distance. In visible light, it's 0.05", or closer to 300 feet. Given that the largest piece of equipment left on the Moon after each mission was the 17.9-foot-high by 14-foot-wide Lunar Module, you can see the problem.
