Java (Simulation) Example (Bio7 2.0)

The simulation describes a CPU, logical memory space, and operating system. Initially, the simulation "fakes" the running of a kernel idle process. There are initially no processes in user space, and both the ready and waiting queues are empty. Spawn a process by hitting the space bar. Spawn as many as you like!

A Framework for Discrete-Event Modelling and Simulation

The main focus of this work is to propose a framework¹ to investigate how enterprises arise, behave and fall, how they interact and, finally, how we

can improve them. The tool that we introduce here to help us in this research effort (our “quest for

public class Simulator extends Object. Represents the executive of a discrete-event simulator. This class maintains a simulation clock, an event list, and starts executing the events in the appropriate order. Its methods permit one to start, stop, and (re)initialize the simulation, and read the simulation clock.

Java is good to the degree that it helps you do this. Algorithm matters, too. If you can rewrite your Monte Carlo simulation so it can run on multiple machines, you might be better off. Java's libraries give it an advantage over the other three languages, because the plumbing is all there. You don't have to buy anything else.
